Education

University of Michigan-Ann Arbor (UM-AA)

MSE in Electrical and Computer Engineering – Computer Vision Sep. 2017 – Apr. 2019

BSE in Computer Science GPA: 3.83/4.00 Sep. 2015 – Apr. 2017

Shanghai Jiao Tong University (SJTU)

BSE in Electrical and Computer Engineering GPA: 3.70/4.00 Sep. 2013 – Aug. 2017

Internship

Software Internship at Huawei Inc. in Shanghai Jun. 2016 – Sep. 2016

Developed a software to read captured network packets

- Thoroughly learned the specification of Wireshark network packet format
- Programmed the file reader to extract all the data following specification from my manager

Graduate level courses

- Matrix Methods in Signal Processing - Gradient methods for machine learning
- Probability and Random process - Estimation and detection
- Parallel computing - Programming on multiple parallel computer architectures

Project Experience

Bosch IoT hackathon：AD Master – Team Leader Jun. 2017 – Jun. 2017

Designed a sensor based advertising system involving 3 different Bosch sensors

- Integrated front-end web page and back-end server to interactively display specific advertisements
- Designed the system structure with all the hardware and software within 2 days
- Led the presentation and won the 1st prize of the hackathon

Capstone design project: Web Crawler for YITU Tech Inc. – Team Leader May. 2017 – Aug. 2017

Designed a web crawler to search for famous people's image data

- Led a team of 5 people for a 3 month commercially sponsored project
- Scheduled 3 design phases and conducted all 3 design reviews and delivery to sponsor
- Wrote and communicated all the specifications with sponsor and teammates

Robotics Course project：M-Constructor – Algorithm Designer Jan. 2017 – May. 2017

Designed the planning algorithm for a mobile robot to construct an M with foam cubes

- Learned and implemented a robust 2D SLAM algorithm that produces at most 2mm error
- Implemented collision avoidance mechanism to deal with sensor failure and network failure
- Implemented the object detection and construction with over 90% success rate

Computer Vision project：License Plate Reader – Algorithm Designer Jan. 2016 – May. 2016

Designed an algorithm to read license plates' characters directly from photos

- Implemented a plate localization algorithm by image filtering from a research paper in MATLAB
- Extended a sample neuron network for number recognition to recognize letters with over 95% accuracy

Operating System projects：Multiple Course Projects Sep. 2016 – Dec. 2016

Implemented a Multithread library, a CPU scheduler, a memory pager and a distributed file system

- Thoroughly learned details of all the concepts and write very robust programs that pass every test

Skillset

Languages: Python, C++, C, CUDA

Software: Linux system, MATLAB, Tensor Flow, Git, Unity, Wireshark
